

XFP-to-XFP 10-Gigabit Repeaters

Overview

The Fiber Driver® XFP-to-XFP media modules from MRV Communications combine ultra high-speed protocol support with the flexibility of XFP transceivers that support SONET OC-192, SONET OC-192 with Forward Error Correction (FEC), 10 Gigabit Ethernet, 10 Gbps Fiber Channel, and G.709. The 2XFP modules enable an extremely wide range of optical infrastructure solutions including media conversion, signal repeating, lambda conversion, and Wave Division Multiplexing (WDM).

2XFPs are an economical alternative for enterprise applications. They are also ideal for large telecommunications carriers moving very large amounts of data to distances over 100 kilometers.

2XFPs are compact, hot-swappable, one-slot modules with two XFP interface ports. Installation and setup is simple plug-n-play. Insert the module into any powered Fiber Driver chassis, insert the XFP transceivers required for the protocol and distance of the application, and then connect to the network.

Datasheet

Changing the connection type only requires changing the hot-swappable XFP transceivers. Because the transceivers are portable, inventory may be shared with other applications to maximize the return on investment. Together, the 2XFP modules and XFP transceivers greatly reduce the need for on-hand parts inventory.

2XFP modules fully support the XFP MSA standard including Digital Diagnostics. Through a Fiber Driver

network management module, they support SNMP and MegaVision Pro®, the MRV Communications comprehensive network management system. The management module monitors XFP status, determines hardware configuration, and provides vendor information.
